ACKNOWLEDGEMENT

First and foremost, we extend our heartfelt thanks to **Asst. Prof. Biman Rimal**, Project Coordinator of the Aerospace Engineering Department, for providing us with continuous support, valuable guidance, and encouragement. We are truly grateful for his coordination, for facilitating the necessary resources, and for supporting us during our free time after our 4th semester examinations to successfully carry out this project. His assistance in providing the drone components and overall project supervision has been invaluable. We would also like to express our deep gratitude to our respected seniors, **Mr. Aniket Gupta** and **Mr. Prakash Paudel**, for their guidance, motivation, and continuous help throughout the project. Their experience and support played an important role in the successful completion of our work. Our appreciation also extends to all teachers, friends, and anyone who directly or indirectly supported us in this project. Their contributions, suggestions, and encouragement have been sincerely acknowledged. Any form of constructive suggestion or criticism is warmly welcomed and highly appreciated

Introduction

Autonomous drones are unmanned aerial systems (UAS) capable of performing missions such as surveillance, mapping, inspection, and delivery without direct human control. This project aims to design, build, and test a fully autonomous quadcopter drone using the **Pixhawk flight controller** and **QGroundControl (QGC)** software.

This documentation covers:

Concepts of drones

Types of drones

Hardware required

Software required

Autopilot overview (Pixhawk)

QGroundControl configurations

Full calibration process

Step-by-step project workflow

Concept of a Drone (UAV)

A **drone** is an unmanned aerial vehicle controlled either remotely or autonomously using onboard sensors and autopilot systems.

Basic Concept

Lift: Generated by spinning propellers.

Thrust: Motor power used for flight and maneuvering

Weight: Total mass resisting lift.

Drag: Air resistance acting against motion.

Control: Achieved using motor RPM variations.

Types of Drones

Based on Structure

a. Multirotor Drones

Quadrotor (4 motors)

Hexacopter (6 motors)

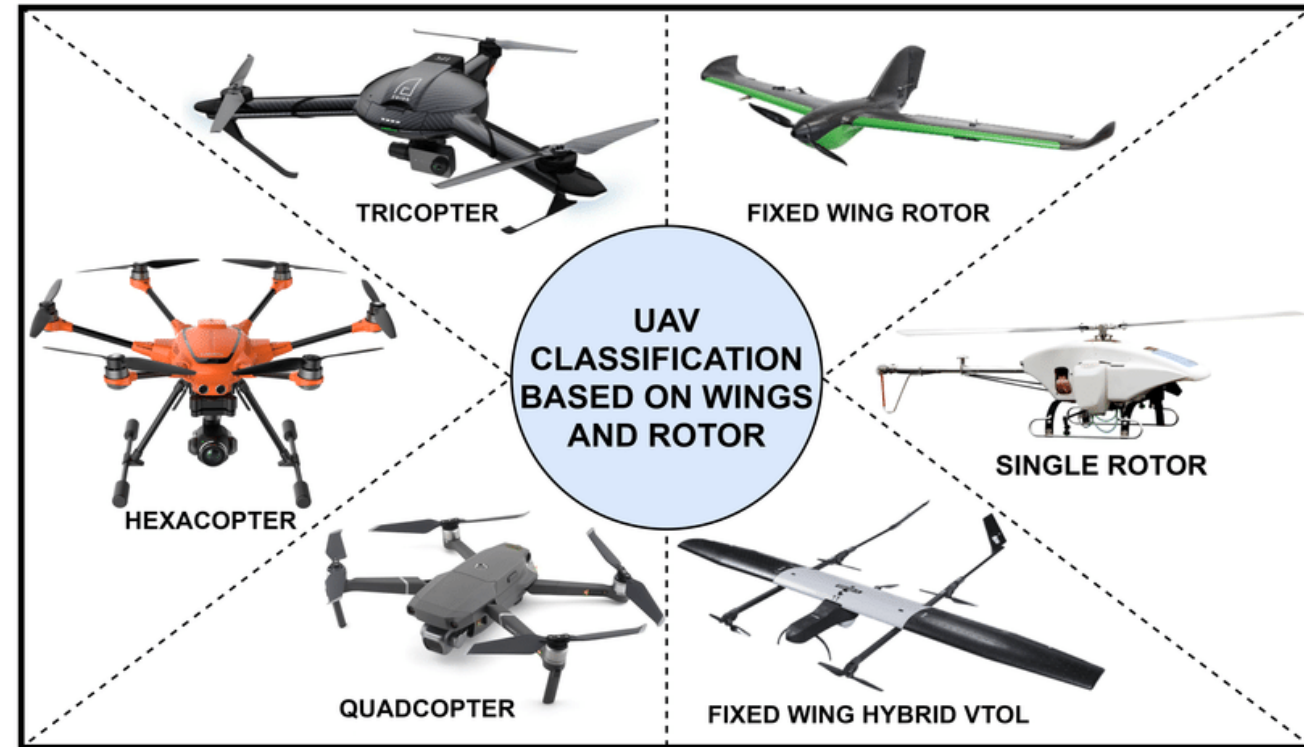

Octocopter (8 motors)

b. Fixed-Wing Drones

Airplane-like, long endurance.

c. VTOL (Vertical Takeoff & Landing)

Hybrid of fixed-wing + multirotor.

Based on Control

Manual

Assisted (GPS hold, Loiter)

Fully Autonomous (Mission mode)

Hardware Requirements

Core Hardware Components

Pixhawk 4 Autopilot

GPS + Compass Module (e.g., Here2 / M8N)

Brushless Motors (4 units)

Electronic Speed Controllers (ESCs)

Propellers (CW + CCW pairs)

LiPo Battery (3S / 4S / 6S)

Power Distribution Board (PDB)

Battery Power Module (Voltage & Current sensor)

Frame (450mm, 500mm, or custom)

Additional Components

Telemetry Radio (433 MHz / 915 MHz)

FPV Camera (optional)

ESC signal wires

XT60/XT90 connectors

Landing gear

GPS mast

Software Requirements

Ground Control Software

QGroundControl (QGC): For configuration, calibration, mission planning

Firmware

PX4 Autopilot Firmware (for Pixhawk)

Pixhawk 4 Autopilot Overview

Pixhawk is the brain of the drone. It handles:

Motor control

Sensors integration

GPS navigation

Flight stabilization

Autonomous mission execution

Sensors in Pixhawk

Accelerometer

Gyroscope

Magnetometer (external compass)

Barometer

GPS

Power monitoring

Inputs & Outputs

PWM outputs for ESCs

RC input

Telemetry ports

I2C for compass

CAN bus

Connect to the Power Management Board using the 6-wire cable to direct power from your lithium polymer (LiPo) battery to the autopilot.

(Optional) Connect a Telemetry Radio to receive data in Ground Control Station and communicate with the autopilot in flight.

Connect to the Power Management Board using the 10 wire cable to send PWM signals to the motors.

Connect PPM, DSM or SBUS Radio Control receiver to provide the autopilot with RC input in manual and assisted flight modes.

Connect the provided GPS module (with integrated compass, safety switch and buzzer) to provide the autopilot with positioning data during flight.

pixhawk[®] 6x

FULL PIXHAWK CALIBRATION PROCEDURE (COMPLETE GUIDE)

- ✓ Motor order
- ✓ ESC calibration
- ✓ Radio calibration
- ✓ Motor direction
- ✓ PID tuning
- ✓ Sensor calibration
- ✓ Power calibration
- ✓ Flight mode setup
- ✓ Mission setup
- All processes in one clean sequence

STEP 1 Prepare Hardware

- ✓ Remove propellers
- ✓ Connect ESC → Pixhawk MAIN OUT (1–4)
- ✓ Connect GPS + Compass
- ✓ Connect RC Receiver
- ✓ Power Pixhawk with USB

STEP 2 QGroundControl Connection

- ✓ Open QGC
- ✓ Connect Pixhawk via USB
- ✓ QGC detects the autopilot
- ✓ Go to Vehicle Setup

STEP 3 Firmware & Airframe Setup

- ✓ Vehicle Setup → Firmware
- ✓ Install PX4 firmware
- ✓ Reboot
- ✓ Go to Airframe
- ✓ Select Quadrotor X
- ✓ Apply → Reboot

STEP 4 —Sensor Calibration (ALL MUST BE DONE)

Accelerometer Calibration

- ✓ Vehicle Setup → **Sensors** → **Accelerometer**
- ✓ Keep drone level
- ✓ Follow steps (6 orientations)
- ✓ Save

Gyroscope Calibration

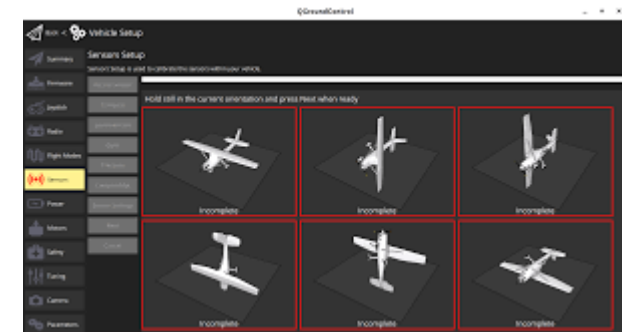

- ✓ Keep drone still
- ✓ QGC calibrates automatically
- ✓ Save

Compass Calibration

- ✓ Sensors → **Compass**
- ✓ Rotate drone in all directions
- ✓ Complete → Save
- ✓ Make sure no magnetic interference

Level Horizon

- ✓ Place drone on a flat surface
- ✓ Press **Level Horizon**
- ✓ This completes sensor calibration.

STEP 5 — Radio Calibration

- ✓ Vehicle Setup → **Radio**
- ✓ Move sticks fully:
 - Throttle
 - Yaw
 - Pitch
 - Roll
- ✓ Move all switches
- ✓ QGC detects max/min PWM
- ✓ Save
- ✓ Set a dedicated **ARM switch** (important)

STEP 6 — Power Module Calibration

- ✓ Vehicle Setup → **Power**
- ✓ Select battery type (3S, 4S, 6S)
- ✓ Select sensor type (usually: *Analog Voltage & Current*)
- ✓ Enter correct:
 - Voltage divider
 - Amperes per volt
- ✓ Connect battery
- ✓ Make sure QGC shows correct real voltage
- ✓ Save

STEP 7 — ESC Calibration

METHOD — Full Automatic (Recommended)

- ✓ Go to **Power**
- ✓ Click "**Calibrate ESC**"
- ✓ Remove battery
- ✓ QGC says: *"Plug in battery now"*
- ✓ Connect battery
- ✓ ESC beeps (max throttle detected)
- ✓ ESC beeps again (min throttle saved)
- ✓ Calibration done
- ✓ This sets equal throttle range for all ESCs.
- ✓ Front

STEP 8 — Motor Order & Test

✓ Correct Quad-X Motor Order

Front
↑
1 2
CW CCW

4 3
CCW CW
↓
Back

✓ Motor Test in QGC

✓ Vehicle Setup → **Motors**

✓ Check safety box

✓ Test each motor A–D

✓ Confirm:

✓ Motor spins in correct order

✓ Direction is correct

If motor spins wrong direction:

✓ Swap any 2 ESC wires (no need to re-program)

STEP 9 — PID Tuning (Basic)

✓ Go to **PID Tuning** in QGC

Recommended starting values:

Roll/Pitch P: 6–8

Roll/Pitch I: 0.2–0.4

Roll/Pitch D: 0.002–0.004

Yaw:

Yaw P: 4–6

Yaw I: 0.1–0.3

Rules:

✓ Fast vibration → D too high

✓ Slow oscillation → P too high

Drift → Increase I

STEP 10 — Flight Modes Setup

✓ Go to **Flight Modes**

✓ Set at least 3:

Stabilized – Manual backup

Position Hold – GPS stabilized

Mission / Auto Mode – Fully autonomous

✓ Assign switches to each mode.

STEP 12 — Autonomous Mission Planning

✓ Go to **Plan** tab

Add:

- ✓ Takeoff command
- ✓ Multiple waypoints
- ✓ Land command

Set:

- ✓ Altitude
- ✓ Speed
- ✓ Upload mission to Pixhawk

.

STEP 13 — Pre-flight Checklist

- ✓ GPS locked (HDOP < 1.0)
- ✓ Compass OK
- ✓ Accelerometer OK
- ✓ RC connected
- ✓ Battery full
- ✓ Motor test completed
- ✓ No vibration
- ✓ Flight modes mapped

STEP 14 — Arming & Test Hover

- ✓ Arm using switch
- ✓ Lift slowly
- ✓ Check:
 - Stability
 - Yaw hold
 - GPS position hold
- ✓ If stable → proceed to autonomous

STEP 15 — Autonomous Flight

- ✓ Switch to **Mission Mode (AUTO)**
- ✓ Drone will:
 - Takeoff
 - Follow all waypoints
 - Land automatically
